

ABSTRACT

Expanded porous polytetrafluoroethylene film laminated into a laminate in the form of a strip, wherein the laminated height of the
5 laminated strip is greater than the width, preferably with a layer for preventing fluid penetration interposed between the layers of the laminate. The sealing material in the form of tape is used in the form of a closed ring, the longitudinal beginning and end being joined, and the laminated end faces on the long side are in contact with the tightened
10 surfaces, in such a way that the direction in which the laminated strip has been laminated is the radial direction.
